(54) Title: HETEROARYL UREA NEUROPEPTIDE Y Y5 RECEPTOR ANTAGONISTS

(57) Abstract: The present invention relates to compounds represented by the struc-
tural Formula I or a pharmaceutically acceptable salt thereof, which are useful for the
treatment of metabolic and eating disorders such as obesity and hyperphagia, and for
the treatment of diabetes and associated disorders.

HETEROARYL UREA NEUROPEPTIDE Y Y5 RECEPTOR ANTAGONISTS

5 This invention relates to heteroaryl urea neuropeptide Y Y5 receptor antagonists useful in the treatment of eating disorders, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds.

 Neuropeptide Y (NPY) is a 36 amino acid neuropeptide that is widely distributed in the central and peripheral nervous systems. NPY is a member of the
10 pancreatic polypeptide family that also includes peptide YY and pancreatic polypeptide (Wahlestedt, C., and Reis, D., Ann. Rev. Toxicol., 32, 309, 1993). NPY elicits its physiological effects by activation of at least six receptor subtypes designated Y1, Y2, Y3, Y4, Y5 and Y6 (Gehlert, D., Proc. Soc. Exp. Biol. Med., 218, 7, 1998; Michel, M. et al., Pharmacol. Rev., 50, 143, 1998). Central administration of
15 NPY to animals causes dramatically increased food intake and decreased energy expenditure (Stanley, B. and Leibowitz, S., Proc. Natl. Acad. Sci. USA 82: 3940, 1985; Billington et al., Am J. Physiol., 260, R321, 1991). These effects are believed to be mediated at least in part by activation of the NPY Y5 receptor subtype. The isolation and characterization of the NPY Y5 receptor subtype has been reported (Gerald, C. et
20 al., Nature, 1996, 382, 168; Gerald, C. et al. WO 96/16542). Additionally, it has been reported that activation of the NPY Y5 receptor by administration of the Y5 – selective agonist [D-Trp³²]NPY to rats stimulates feeding and decreases energy expenditure (Gerald, C. et al., Nature, 1996, 382, 168; Hwa, J. et al., Am. J. Physiol., 277 (46), R1428, 1999). Hence, compounds that block binding of NPY to the NPY Y5 receptor
25 subtype should have utility in the treatment of eating disorders such as obesity, bulimia nervosa, anorexia nervosa, and in the treatment of disorders associated with obesity such as type II diabetes, insulin resistance, hyperlipidemia, and hypertension.

 Published PCT patent application WO 00/27845 describes a class of compounds, characterized therein as spiro-indolines, said to be selective
30 neuropeptide Y Y5 receptor antagonists and useful for the treatment of obesity and the complications associated therewith. Known urea derivatives indicated as possessing therapeutic activity are described in U.S. Patent Nos. 4,623,662 (antiatherosclerotic agents) and 4,405,644 (treatment of lipometabolism).

Except where stated otherwise, the following definitions apply throughout the present specification and claims. Additionally, all technical and scientific terms used herein have the same meaning as is commonly understood by one of skill in the art to which this invention belongs. These definitions apply regardless of whether a term is used by itself or in combination with other terms. Hence the definition of "alkyl" applies to "alkyl" as well as to the "alkyl" portions of "alkoxy", etc.

- 8 -

Alkyl represents a straight or branched saturated hydrocarbon chain having the designated number of carbon atoms. Where the number of carbon atoms is not specified, 1 to 6 carbons are intended.

Halo represents fluoro, chloro, bromo or iodo.

5 Aryl refers to a mono- or bicyclic ring system having one or two aromatic rings including, but not limited to, phenyl, naphthyl, tetrahydronaphthyl, indanyl, and the like. The aryl group can be unsubstituted or substituted with one, two, or three substituents independently selected from lower alkyl, halo, cyano, nitro, haloalkyl, hydroxy, alkoxy, carboxy, carboxamide, mercapto, sulfhydryl, amino, alkylamino and dialkylamino.

10 Heteroaryl refers to 5- to 10-membered single or benzofused aromatic rings consisting of 1 to 3 heteroatoms independently selected from the group consisting of -O-, -S-, and -N=, provided that the rings do not possess adjacent oxygen and sulfur atoms. The heteroaryl group can be unsubstituted or substituted with one, two, or three substituents independently selected from lower alkyl, halo, cyano, nitro,
15 haloalkyl, hydroxy, alkoxy, carboxy, carboxamide, mercapto, sulfhydryl, amino, alkylamino, dialkylamino.

When a variable appears more than once in the structural formula, the identity of each variable appearing more than once may be independently selected from the definition for that variable.

20 N-oxides can form on a tertiary nitrogen present in an R substituent, or on =N- in a heteroaryl ring substituent and are included in the compounds of Formula I.

The expression "prodrug" refers to compounds that are drug precursors which following administration, release the drug *in vivo* via some chemical or physiological process (e.g., a prodrug on being brought to the physiological pH or through enzyme
25 action is converted to the desired drug form).

The term "chemically stable compound" is defined as a compound that can be isolated, characterized, and tested for biological activity.

For compounds of the invention having at least one asymmetrical carbon atom, all isomers, including diastereomers, enantiomers and rotational isomers are
30 contemplated as being part of this invention. The invention includes d and l isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques, either by reacting optically enriched or optically pure starting materials or by separating isomers of a compound of Formula I.

- 9 -

Compounds of Formula I can exist in unsolvated and solvated forms, including hydrated forms. In general, the solvated forms, with pharmaceutically acceptable solvents such as water, ethanol and the like, are equivalent to the unsolvated forms for purposes of this invention.

5 A compound of Formula I may form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free
10 base forms with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution, such as dilute aqueous sodium hydroxide, potassium carbonate, ammonia or sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties,
15 such as solubility in polar solvents, but the salts are otherwise equivalent to their respective free base forms for purposes of the invention.

In a preferred group of compounds of Formula I, the heterocyclic group attached to Z is

This invention is also directed to pharmaceutical compositions for the treatment of obesity which comprise an obesity treating amount of a compound of Formula, I, a
10 prodrug thereof, or a pharmaceutically acceptable salt of said compound or of said prodrug and a pharmaceutically acceptable carrier therefor.

Compounds of Formula I may be produced by processes known to those skilled in the art and as shown in the following reaction schemes and in the
15 preparations and examples below.

- 13 -

Scheme 1

- 5 In Scheme 1, a nitro heteroaryl halide is coupled to an aryl boronic acid to give a nitro-substituted biaryl derivative. Reduction of the nitro group gives a biaryl amine derivative. Alternatively, an amino heteroaryl halide derivative is coupled to an aryl boronic acid derivative to directly give an amino biaryl derivative. Treatment of the biaryl amine with a reagent such as phenyl chloroformate, 4-nitrophenyl
- 0 chloroformate, triphosgene, or N,N' -disuccinimidyl carbonate and an organic base, followed by an amino substituted cyclic amine derivative with the ring nitrogen protected, gives a urea derivative (path A). Cleavage of the protecting group provides an amine that can be derivatized by treatment with, for example, acyl chlorides,

- 14 -

sulfonyl chlorides, and isocyanates. Alternatively, in the urea-forming step an amino substituted cyclic amine derivative wherein the ring nitrogen is derivatized with an R^9 substituent can be used (path B). Path B is the preferred method when R^9 is aryl or

heteroaryl. Compounds of Formula I where  is

Scheme 2

10

In Scheme 2, a biaryl amine derivative is treated with triphosgene and a base followed by treatment with 4-(methylamino)cyclohexanone ethylene ketal to give a urea derivative. Deprotection of the ketal, for example, by treatment with a strong acid, gives a ketone derivative. The ketone can then be derivatized by treatment with

15 QNH_2 .

- 15 -

Scheme 3

In Scheme 3, an acid chloride is condensed with thiosemicarbazide to give an N-acyl thiosemicarbazide derivative. Treatment of the N-acyl thiosemicarbazide with a strong acid results in the formation of an aminothiadiazoole derivative. The aminothiadiazoole is converted to a substituted urea derivative as described earlier.

Scheme 4

In Scheme 4 an alpha bromo acetal is condensed with thiourea to form a 5-substituted 2-aminothiazole derivative. The 2-aminothiazole derivative is converted to a substituted urea derivative as described in earlier schemes.

Scheme 5

- 16 -

In Scheme 5, a 5-halo-2-nitrothiazole derivative is coupled to an aryl zinc halide under palladium catalysis to give a 2-aryl-5-nitrothiazole derivative. The 5-nitrothiazole derivative is then converted to a substituted urea derivative as described in earlier Schemes.

The compounds of Formula I exhibit selective neuropeptide Y Y5 receptor antagonizing activity, which has been correlated with pharmaceutical activity for treating eating disorders, such as obesity and hyperphagia, and diabetes.

The compounds of Formula I display pharmacological activity in test procedures designed to demonstrate neuropeptide Y Y5 receptor antagonist activity. The compounds are non-toxic at pharmaceutically therapeutic doses. Following are descriptions of the test procedures.

cAMP Assay

HEK-293 cells expressing the Y5 receptor subtype were maintained in Dulbecco's modified Eagles' media (Gico-BRL) supplemented with 10% FCS (ICN), 1% penicillin-streptomycin and 200 $\mu\text{g/ml}$ Geneticin® (GibcoBRL #11811-031) under a humidified 5% CO_2 atmosphere. Two days prior to assay, cells were released from T-175 tissue culture flasks using cell dissociation solution (1X; non-enzymatic [Sigma #C-5914]) and seeded into 96-well, flat-bottom tissue culture plates at a density of 15,000 to 20,000 cells per well. After approximately 48 hours, the cell monolayers were rinsed with Hank's balanced salt solution (HBSS) then preincubated with approximately 150 $\mu\text{l/well}$ of assay buffer (HBSS supplemented with 4 mM MgCl_2 , 10 mM HEPES, 0.2% BSA [HH]) containing 1 mM 3-isobutyl-1-methylxanthine ([IBMX])

- 17 -

Sigma #1-587) with or without the antagonist compound of interest at 37°C. After 20 minutes the 1 mM IBMX-HH assay buffer (\pm antagonist compound) was removed and replaced with assay buffer containing 1.5 μ M (CHO cells) or 5 μ M (HEK-293 cells) forskolin (Sigma #F-6886) and various concentrations of NPY in the presence or
5 absence of one concentration of the antagonist compound of interest. At the end of 10 minutes, the media were removed and the cell monolayers treated with 75 μ l ethanol. The tissue culture plates were agitated on a platform shaker for 15 minutes, after which the plates were transferred to a warm bath in order to evaporate the ethanol. Upon bringing all wells to dryness, the cell residues were resolubilized with
10 250 l FlashPlate® assay buffer. The amount of cAMP in each well was quantified using the [125 I]-cAMP FlashPlate® kit (NEN #SMP-001) and according to the protocol provided by the manufacturer. Data were expressed as either pmol cAMP/ml or as percent of control. All data points were determined in triplicate and EC₅₀'s (nM) were calculated using a nonlinear (sigmoidal) regression equation (GraphPad Prism™).

15 The K_B of the antagonist compound was estimated using the following formula:

$$K_B = [B] / (1 - \{[A'] / [A]\})$$

where [A] is the EC₅₀ of the agonist (NPY) in the absence of antagonist,

[A'] is the EC₅₀ of the agonist (NPY) in the presence of antagonist,

and [B] is the concentration of the antagonist.

NPY Receptor Binding Assay

Human NPY Y5 receptors were expressed in CHO cells. Binding assays were performed in 50 mM HEPES, pH 7.2, 2.5 mM CaCl₂, 1 mM MgCl₂ and 0.1% BSA containing 5-10 μ g of membrane protein and 0.1 nM 125 I-peptide YY in a total volume
25 of 200 μ l. Non-specific binding was determined in the presence of 1 μ M NPY. The reaction mixtures were incubated for 90 minutes at room temperature then filtered through Millipore MAFC glass fiber filter plates which had been pre-soaked in 0.5% polyethyleneimine. The filters were washed with phosphate-buffered saline, and radioactivity was measured in a Packard TopCount scintillation counter.

30

The pharmaceutical compositions containing the active ingredient may be in a
20 form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group
25 consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium
30 carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by

- 21 -

known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in the U.S. Pat. Nos. 4,256,108; 5 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for controlled release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredients is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or a soft gelatin capsules where in the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin 10 or olive oil.

Aqueous suspensions contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example, sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethyl-cellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth 15 and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example, lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example, heptadecaethylene-oxycetanol, or condensation products of ethylene oxide with partial esters derived 20 from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example, polyethylene sorbitan monooleate. The oily suspensions may contain a thickening agent, for 30 example, beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

- 22 -

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, e.g., sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of an oil-in-water emulsions. The oily phase may be a vegetable oil, e.g., olive oil or arachis oil, or a mineral oil, e.g., liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, e.g., soy beans, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, e.g., polyoxyethylene sorbitan monooleate. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, e.g., as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Compounds of the invention may also be administered in the form of suppositories for rectal administration of the drug. The compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

- 23 -

For topical use, creams, ointments, jellies, solutions or suspensions, etc., containing the compound of the invention are employed. (For purposes of this application, topical application shall include mouthwashes and gargles.)

The compounds for the present invention can be administered in the intranasal
5 form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in the art. To be administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen. Compounds of the present invention may also be delivered as a

The dosage regimen utilizing the compounds of the present invention is selected in accordance with a variety of factors including type, species, weight, sex
15 and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound thereof employed. A physician or veterinarian of ordinary skill can readily determine and prescribe the effective amount of the drug required to prevent, counter, arrest or reverse the progress of the condition. Optimal precision in achieving
20 concentration of drug within the range that yields efficacy without toxicity requires a regimen based on the kinetics of the drug's availability to target sites. This involves a consideration of the distribution, equilibrium, and elimination of a drug. Preferably, doses of the compound of structural The invention useful in the method of the present invention range from 0.01 to 1000 mg per adult human per day. Most preferably,
25 dosages range from 0.1 to 500 mg/day. For oral administration, the compositions are preferably provided in the form of tablets containing 0.01 to 1000 milligrams of the active ingredient, particularly 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0, 50.0, 100 and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. An effective amount of the drug is ordinarily
30 supplied at a dosage level of from about 0.0002 mg/kg to about 50 mg/kg of body weight per day. The range is more particularly from about 0.001 mg/kg to 1 mg/kg of body weight per day.

- 24 -

Advantageously, the active agent of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in dividend doses of two, three or four time daily.

The amount of active ingredient that may be combined with the carrier
5 materials to produce single dosage form will vary depending upon the host treated and the particular mode of administration.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of administration, route or administration, rate of excretion, drug
10 combination and the severity of the particular disease undergoing therapy.

The invention disclosed herein is exemplified by the following preparations and examples which should not be construed to limit the scope of the disclosure. Alternative mechanistic pathways and analogous structures may be apparent to those skilled in the art.

Step 1

5 A solution of 2-hydroxy-5-nitropyridine (11.2 g, 79.9 mmol) in conc. HCl (57 ml) was warmed to 50 °C and KClO₃ (3.4 g, 27.7 mmol) in water (50 ml) was added dropwise at such a rate that the temperature was kept below 60 °C. During the addition the product began to separate. After TLC monitoring indicated complete consumption of starting material the mixture was cooled to 0 °C and the product was
 10 isolated by vacuum filtration. The solid was washed with water and dried at 50 °C under vacuum to give the product (12.3g, 88%) as a solid. ¹HNMR (DMSO-d₆) δ 8.68 (d, J = 3.2 Hz, 1H), 8.40 (d, J = 3.2 Hz, 1H). MS m/e 175 (M+H)⁺.

Step 2

15 To phosphoryl chloride (10.5 g, 68.7 mmol) was added successively, with cooling at 5 °C, quinoline (4.4 g, 34.1 mmol) and the product of Step 1 (12.0 g, 68.7 mmol). The resultant mixture was heated for 2 hr at 120 °C under N₂. After the reaction was complete as indicated by TLC monitoring, the reaction mixture was
 20 allowed to cool to 100 °C, and water (26 ml) was added. The solution was then cooled in an ice bath and the product was isolated by vacuum filtration. The solid was washed with water and dried at 40 °C under vacuum to give the product (12.5g, 94%).

A flask charged with 3-fluorophenylboronic acid (1.63 g, 11.65 mmol), the product of Step 2 (1.50g, 7.77mmol), ethylene glycol dimethyl ether (18 ml) and potassium phosphate (4.95 g, 23.3 mmol) was purged with N₂. PdCl₂(dppf)₂·CH₂Cl₂ (0.26 g, 0.32 mmol) was added. The reaction mixture was heated at 80°C under N₂ for 2 hr, allowed to cool, and filtered through celite. The filtrate was extracted with EtOAc (60 ml) was then washed with saturated sodium carbonate (40ml), water (40ml), brine (30 ml), dried (Na₂SO₄), filtered and concentrated. The residue was subjected to flash chromatography (1:5 CH₂Cl₂/hexane) to give the product (1.96g, 100%). ¹HNMR (CDCl₃) δ 9.39 (d, J = 2.4 Hz, 1H), 8.62 (d, J = 2.4 Hz, 1H), 7.62 (m, 1H), 7.54 (m, 2H), 7.22 (m, 1H). MS m/e 253 (M+H)⁺.

Step 4

To an ice-cold solution of the product of Step 3 (2.25 g, 8.9 mmol) and nickel chloride hexahydrate (4.23 g, 17.8 mmol) in MeOH (100 ml) was added sodium borohydride (1.11 g, 29.5 mmol) in portions. The resulting mixture was stirred at 0-5 °C for 30 min., water (5ml) was added and the whole was concentrated. The residue was treated with EtOAc (100ml) and filtered through celite. The filtrate was dried (MgSO₄), filtered and concentrated to give the product (2.3 g). ¹HNMR (CDCl₃) δ 7.53 (s, 1H), 6.97 (m, 1H), 6.84 (m, 2H), 6.63 (s, 1H), 6.53 (m, 1H), 3.90 (s, b, 2H).

The mixture was heated at 65 °C for 3 hr. The residue was allowed to cool, diluted with CH₂Cl₂ (50 ml) and washed with sat'd NaHCO₃ (30 ml), water (30 ml), and NaCl (30 ml). The organic layer was dried (MgSO₄), filtered and evaporated. The residue was subjected to flash chromatography (2:98 CH₃OH/CH₂Cl₂) to give the product (530 mg, 51%). ¹H NMR (CDCl₃) δ 8.41 (d, J = 2.4 Hz, 1H), 8.28 (d, J = 2.4 Hz, 1H), 7.50 (m, 1H), 7.42 (m, 2H), 7.10 (m, 1H), 6.61 (s, 1H), 4.41 (m, 1H), 4.22 (m, 2H), 2.92 (s, 3H), 2.80 (m, 2H), 1.70-1.57 (m, 4H), 1.45 (s, 9H).

Step 1

To a solution of 2-amino-5-bromopyridine (5.00 g, 28.9 mmol) in anhydrous pyridine (50 ml) was added phenyl chloroformate (4.0 ml, 31.8 mmol) dropwise under argon. The reaction mixture was stirred for 22 hr, then poured into EtOAc (200 ml). The resultant precipitate was collected, washed with EtOAc, and dried in vacuo.

To a solution of the crude product was added Preparation 1 (6.19 g, 28.9 mmol), Et₃N (12.0 ml, 86.7 mmol) and CHCl₃ (100 ml). The reaction mixture was refluxed for 24 hr, allowed to cool and poured into cold H₂O (~200 ml). The whole was extracted with CH₂Cl₂ (3x200 ml), dried (Na₂SO₄), filtered and evaporated. The residue was subjected to flash chromatography (1:4 then 1:2 EtOAc/hexane) to give the product as a solid (7.20 g, 60%). ¹H NMR (CDCl₃) δ 8.17 (m, 1H), 7.94 (m, 1H), 7.68 (m, 1H), 7.22 (s, 1H), 4.32 (m, 1H), 4.18 (s, b, 2H), 2.83 (s, 3H), 2.74 (m, 2H), 1.58 (m, 4H), 1.41 (s, 9H). 11

Step 1

11-1

Reaction of 2-amino-5-bromopyrazine and Preparation 11 by the procedure of Example 10, Step 2 gave the product. ¹HNMR (CDCl₃) δ 9.18 (d, J = 1.2 Hz, 1H), 8.26 (d, J = 1.2 Hz, 1H), 7.11 (s, 1H), 4.42 (m, 1H), 3.93 (m, 2H), 2.95 (s, 3H), 2.79 (m, 5H), 1.81 (m, 4H). MS m/e 394 (M+H)⁺.

10

Step 2.

A flask charged with 11-1 (0.090 g, 0.23 mmol), 2,5-difluorophenylboronic acid (0.044 g, 0.28 mmol), toluene (10 ml), water (0.3 ml) and cesium carbonate (0.082 g, 0.25 mmol) was purged with N₂. PdCl₂(dppf)₂CH₂Cl₂ (0.015 g, 0.019 mmol) was added and the reaction mixture was refluxed for 3 hr, allowed to cool, and filtered. The concentrated filtrate was subjected to PTLC (1:1 acetone/hexane) to give the product (0.046 g, 47%). ¹H NMR (CDCl₃) δ 9.47 (d, J = 1.6 Hz, 1H), 8.72 (m, 1H), 7.78 (m, 1H), 7.22 (s, 1H), 7.15 (m, 1H), 7.06 (m, 1H), 4.48 (m, 1H), 3.95 (m, 2H), 2.98 (s, 3H), 2.83 (m, 5H), 1.86 (m, 4H). Step 1

To an ice-cold suspension of (methoxymethyl)triphenylphosphonium chloride
5 (30.4 g, 89 mmol) in Et₂O (250 ml) was added 1.8 M phenyllithium (49.3 ml, 89 mmol)
dropwise under N₂. After the addition was complete, the reaction mixture was stirred
at 0 °C for 0.25 hr, then at R.T. for 0.5 hr. The reaction mixture was cooled to -10 °C
and 3-fluorobenzaldehyde (10 g, 81 mmol) was added dropwise. The reaction mixture
was stirred at R.T. overnight, then sat'd NH₄Cl was added. The aqueous layer was
10 extracted with Et₂O (2x), and the combined organic layers were dried (Na₂SO₄),
filtered, and concentrated. Flash chromatography (hexane) of the residue afforded
the product (8.67 g, 70%) as a mixture of isomers. ¹H NMR (CDCl₃, 400 MHz, major
isomer) δ 7.36 (1H, m), 7.32 (1H, m), 7.07 (1H, d, J = 17 Hz), 6.96 (1H, m), 6.93 (1H,
m), 5.77 (1H, d, J = 17 Hz), 3.70 (3H, s).

This application contains claims directed to more than one species of the generic invention. These species are deemed to lack Unity of Invention because they are not so linked as to form a single inventive concept under PCT Rule 13.1. The species are as follows:

I. Compounds of formula I where Heterocyclic ring attached to variable Z represents a pyridine ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

II. Compounds of formula I where Heterocyclic ring attached to variable Z represents a pyridazine ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

III. Compounds of formula I where Heterocyclic ring attached to variable Z represents a pyrimidine ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

IV. Compounds of formula I where Heterocyclic ring attached to variable Z represents a pyrazine ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

V. Compounds of formula I where Heterocyclic ring attached to variable Z represents a thiazole ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

VI. Compounds of formula I where Heterocyclic ring attached to variable Z represents a thiophene ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

VII. Compounds of formula I where Heterocyclic ring attached to variable Z represents a oxazole ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

VIII. Compounds of formula I where Heterocyclic ring attached to variable Z represents a diazole ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

IX. Compounds of formula I where Heterocyclic ring attached to variable Z represents a thiadiazole ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

X. Compounds of formula I where Heterocyclic ring attached to variable Z represents an oxadiazole ring, pharmaceutical compositions containing these compounds and a method of using these compounds.

The claims are deemed to correspond to the species listed above in the following manner:

Species I : Claims 5-11

Species II : Claim 17

Species III : Claims 15 and 16

Species IV : Claims 12-14

Species VI : Claim 18

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US01/49309

Species IX : Claims 19 and 20

The following claims are generic: Claims 1-4 and 21-31

The species listed above do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, the species lack the same or corresponding special technical features for the following reasons:

There is no common core which in the Markush Practice, is a significant structural element shared by all of the alternatives; see PCT Administrative Instructions Annex B Part I (f) (i) (B) (1).
